

Assignment-2 Session1

Question 1: List 3 key responsibilities each for a Tester and a Test Leader in a software project, and give one example of how each role contributes during a release cycle.

Answer

Responsibilities of a Software Tester

1. Test Case Design

- Prepare test cases based on the project requirements.
- Ensure all functional and non-functional scenarios are covered.

2. Test Execution

- Execute test cases and verify whether the application behaves as expected.
- Record actual results and compare them with expected results.

3. Defect Reporting

- Identify defects, assign severity and priority, and report them using a defect tracking tool such as JIRA.

Example During Release Cycle

Before a new version of a food delivery app is released, the tester verifies login, restaurant search, cart, payment, and order tracking to ensure all features work correctly.

Responsibilities of a Test Leader

1. Test Planning

- Prepare the overall testing strategy and define testing objectives.

2. Team Management

- Assign testing tasks to team members and monitor progress.

3. Release Coordination

- Review testing status, defect reports, and approve whether the application is ready for release.

Example During Release Cycle

The Test Leader reviews all reported defects, confirms that critical defects are fixed, and gives the final testing sign-off before deployment.

Question 2: Pick any app you use daily (Instagram, Zomato, Paytm, etc.) and write a one-paragraph comparison of how Quality Assurance (QA) and Quality Control (QC) would be performed for that app.

Answer

Application: Zomato

Quality Assurance (QA) focuses on preventing defects by defining proper development processes before coding begins. For example, the QA team reviews requirements, prepares testing strategies, and ensures coding standards are followed while developing the food ordering feature. Quality Control (QC) is performed after development, where testers execute test cases, verify restaurant search, cart functionality, payment processing, and order tracking, identify defects, and report them to developers for correction. In simple words, QA focuses on improving the process, while QC focuses on verifying the final product.

Question 3: Explain the difference between Testing and Debugging by describing what a tester does vs what a developer does when a bug is found in a Flipkart-style shopping cart feature.

Answer

Testing is the process of checking whether the application works according to the requirements. It is performed by testers.

Debugging is the process of identifying the root cause of a defect in the source code and fixing it. It is performed by developers.

Example

Suppose a customer adds a product to the shopping cart, but the quantity is not updated correctly.

Tester's Role

- ✓ Execute the test case.
- ✓ Reproduce the issue.
- ✓ Record expected and actual results.
- ✓ Report the defect with screenshots and steps to reproduce.

Developer's Role

- ✓ Analyze the source code.
- ✓ Find the logic causing the quantity issue.
- ✓ Fix the code.
- ✓ Deliver the updated build for retesting.

Difference

Testing	Debugging
Performed by Testers	Performed by Developers
Finds defects	Fixes defects
No code modification	Source code is modified
Ensures software quality	Removes the root cause of defects

Question 4: Create a basic Test Plan Skeleton for a new feature in a food delivery app.

Answer

Test Plan

Test Plan ID

TP_FDA_001

Feature Description

Promo Code Feature

This feature allows users to apply valid promotional coupons during checkout to receive discounts on food orders.

Test Scope

In Scope

- ✧ Apply valid promo code
- ✧ Apply invalid promo code
- ✧ Expired promo code
- ✧ Minimum order value validation
- ✧ Maximum discount validation
- ✧ Single-use coupon validation

Out of Scope

- ✧ Payment gateway testing
- ✧ Restaurant onboarding
- ✧ Delivery partner application

Roles & Responsibilities

Test Leader

- ✧ Prepare test plan

- ✧ Review test progress
- ✧ Approve release
- ✧ **Tester**
- ✧ Prepare test cases
- ✧ Execute test cases
- ✧ Report defects
- ✧ Perform regression testing

Developer

- ✧ Fix reported defects
- ✧ Deliver updated builds

Test Environment

- ✧ Operating System: Windows 11
- ✧ Browser: Google Chrome, Microsoft Edge
- ✧ Mobile Devices: Android and iPhone
- ✧ Test Server: Staging Environment
- ✧ Database: Test Database

Test Deliverables

- ✧ Test Plan
- ✧ Test Cases
- ✧ Test Execution Report
- ✧ Defect Report
- ✧ Test Summary Report
- ✧ Release Sign-off

Entry Criteria

- ✧ Requirements approved
- ✧ Build received
- ✧ Test environment ready

Exit Criteria

- ✧ All critical defects fixed
- ✧ Regression testing completed
- ✧ Test summary report approved
