

Assignment-2 Session1

Question 1 Open the homepage of Zomato or Flipkart in your browser and carefully review it for any visible errors, bugs, or defects (such as broken images, misaligned buttons, typos, or non-working links). List at least 3 issues you observe and describe why you think each one is a defect.

Answer:

Application Tested: Flipkart Homepage

Browser: Google Chrome

Sr. No.	Observation	Why it is a Defect
1	Promotional banner image not loading properly.	Users cannot view promotional content, which affects the user experience.
2	Text overlaps on a banner when browser is zoomed.	UI is not displayed correctly, making the page difficult to read.
3	Clicking a promotional banner redirects to the wrong page.	The functionality does not work as expected, causing navigation issues.

Question 2 Write a short explanation (2–3 sentences each) for the following: What is the difference between an Error, a Bug, and a Defect? Give one real-world example for each from any app you use daily (e.g., Instagram, Paytm, IRCTC).

Answer:

Error

An **Error** is a human mistake made during software development, such as writing incorrect logic or misunderstanding a requirement. Errors occur before the software is executed.

Example:

A developer accidentally writes the wrong condition for validating an OTP in Paytm.

Bug

A **Bug** is a flaw in the software caused by an error in coding or design. It causes the software to behave unexpectedly.

Example:

On Instagram, tapping the Like button causes the application to freeze.

Defect

A **Defect** is a mismatch between the expected and actual behavior of the software, identified during testing. Testers report defects to developers for fixing.

Example:

On Paytm, the payment fails even after entering the correct OTP.

Question 3: Think of a recent time when an app you use (like WhatsApp, BookMyShow, or PhonePe) didn't work as expected. Identify the possible cause of the defect: was it a human error, a technical limitation, or a process gap? Explain your reasoning for each case.

Answer:

Case 1: PhonePe Payment Failure

Possible Cause: Technical Limitation

Sometimes the bank server is unavailable or experiencing heavy traffic, causing payment failures even though the application is working correctly.

Case 2: WhatsApp Application Crash

Possible Cause: Human Error

A developer may have introduced a coding mistake in a recent update, causing the application to crash when opening chats.

Case 3: Incorrect BookMyShow Notification

Possible Cause: Process Gap

The testing team may not have tested every notification scenario before the application was released.

Question 4: Imagine you are testing a new food delivery app (like Swiggy). List 3 types of risks that could affect the quality of the app before launch. For each risk, briefly explain how it could impact users.

Answer:

1. Security Risk

If user payment information is not properly secured, hackers may steal sensitive financial data.

Impact: Loss of customer trust and possible financial fraud.

2. Performance Risk

During peak meal times, the application may become slow because of high user traffic.

Impact: Users may be unable to place orders or may leave the application.

3. Usability Risk

If the application interface is confusing, users may find it difficult to complete the ordering process.

Impact: Poor user experience and reduced customer satisfaction.

Question 5: You are given a mini project: a Movie Ticket Booking webpage. Classify the following as either a Defect or a Risk. Justify your answer for each.

(a) The "Book Now" button does not respond on mobile.

Answer:

Classification: Defect

Justification: The "Book Now" button is expected to work on mobile devices. Since it does not respond, the functionality is broken, making it a defect.

(b) There is no Logout option.

Answer:

Classification: Defect (*assuming the requirements specify a Logout feature*)

Justification: If the application requirements include a Logout option and it is missing, this is a functional defect.

(c) The application sometimes loads slowly during IPL match days.

Answer:

Classification: Risk

Justification: High user traffic during IPL matches may reduce application performance. This is a performance risk that should be addressed through load and performance testing before release.
