

Assignment-2 Session16

Question 1: Pick any one feature from a popular app you use (like Instagram's Post Upload, Zomato's Order Placement, or Flipkart's Add to Cart) and write 3 test cases you would re-test after a bug fix is made to that feature.

Answer

Application: Flipkart

Feature: Add to Cart

Bug Fixed: Clicking the "Add to Cart" button was not adding the selected product to the cart.

Re-Testing Test Cases

Test Case ID	Test Scenario	Expected Result
RTC-001	Click Add to Cart for one product.	Product should be added successfully to the cart.
RTC-002	Add the same product twice.	Product quantity should increase instead of creating duplicate entries.
RTC-003	Verify cart count after adding multiple products.	Cart count should match the total number of added items.

Question 2: Imagine you are testing the "Apply Coupon" feature on Swiggy. After a bug related to coupon validation is fixed, design a re-testing checklist with at least 4 steps.

Answer

Re-Testing Checklist

- ✓ **Step 1:** Apply a valid coupon code and verify the correct discount is applied.
- ✓ **Step 2:** Apply an expired coupon code and verify an appropriate validation message is displayed.
- ✓ **Step 3:** Apply an invalid coupon code and verify the application rejects it without crashing.
- ✓ **Step 4:** Apply the coupon when the minimum order value is not met and verify the correct error message is displayed.

✓ **Step 5:** Verify that the total payable amount is calculated correctly after applying a valid coupon.

Question 3: Create a regression test suite for the "Search" module in a music streaming app (like Spotify). List at least 5 regression test cases.

Answer

Application: Spotify

Module: Search

Test Case ID	Regression Test Case	Expected Result
REG-001	Search using a valid song name.	Matching songs should be displayed.
REG-002	Search using an artist name.	Artist profile and songs should appear.
REG-003	Search using a playlist name.	Matching playlists should be displayed.
REG-004	Search using an invalid keyword.	"No Results Found" message should be displayed.
REG-005	Search should work correctly after changing the application language.	Search results should still be accurate.

Question 4: Explain why regression testing is especially important in Agile development when teams release new features every sprint. Give two examples.

Answer

In Agile development, new features are developed and released in every sprint. Changes made to one module can unintentionally affect existing features. Regression testing ensures that previously working functionality continues to work correctly after new code is added or existing code is modified.

Example 1 – Zomato

A new **Coupon Discount** feature is introduced. Without regression testing, the existing **Order Placement** feature may stop calculating the total bill correctly.

Example 2 – Instagram

A new **Story Feature** is released. Without regression testing, the existing **Photo Upload** feature could start failing or images might not upload successfully.

Regression testing helps detect these unintended side effects before the application is released to users.

Question 5: Suppose your team just released a new version of a movie ticket booking app (like BookMyShow) with a major update to the Payment module. Select 3 modules (other than Payment) that could be affected and describe one regression test for each.

Answer

Module	Regression Test	Expected Result
Seat Selection	Verify selected seats remain reserved after successful payment.	Seats should remain correctly reserved for the user.
Booking History	Verify completed bookings appear in the booking history after payment.	Booking details should be displayed correctly.
Notifications	Verify booking confirmation SMS/email/push notification is sent after successful payment.	User should receive the correct booking confirmation notification.

Difference Between Re-Testing and Regression Testing

Re-Testing	Regression Testing
Verifies a specific defect after it has been fixed.	Verifies that existing features still work after changes or bug fixes.
Focuses only on the failed test cases.	Covers related and existing functionalities that may be impacted.
Performed after developers fix a reported defect.	Performed after every build, enhancement, or bug fix.
Objective is to confirm the defect is fixed.	Objective is to ensure no new defects have been introduced.
