

Assignment-5

1. List 3 repetitive actions you perform while using any app that could be automated.

Action 1: Logging into Instagram

Why Automation Helps:

Automation can enter the username and password automatically and log in within a few seconds. It saves time and reduces manual effort.

Action 2: Searching for a Product on Flipkart

Why Automation Helps:

Automation can open Flipkart, search for a product, apply filters, and verify the search results quickly without repeating the same steps manually.

Action 3: Ordering Food on Zomato

Why Automation Helps:

Automation can search for a restaurant, add a food item to the cart, and verify the order process. This helps in testing the application repeatedly with less effort.

2. Selenium IDE Practical

Aim:

Record and play back a login test using Selenium IDE.

Steps Performed:

1. Installed Selenium IDE extension in Chrome.
2. Opened Selenium IDE.
3. Created a new project.
4. Started recording.

Opened the website:

<https://opensource-demo.orangehrmlive.com/>

- 1) Entered the Username and Password.
- 2) Clicked the Login button.
- 3) Stopped recording.
- 4) Played the recorded test case.

5) Verified that the login steps executed successfully.

Result:

The login test was successfully recorded and executed using Selenium IDE.

3. Katalon Studio Practical

Areas Explored:

1. New Test Case

File → New → Test Case

2. Add Test Steps

Manual View → Add → Web UI Keywords

3. Run Test

Click the **Run** button (Green Play Button) on the toolbar.

Result:

Successfully explored the Katalon Studio interface and identified the options for creating, editing, and running test cases.

4. Comparison Table

Tool Name	Type of Testing	Scripting Required	Example Use Case
Selenium	Web Automation Testing	Yes (Java, Python, C#, etc.)	Automating login page testing
Cypress	Web Automation Testing	Yes (JavaScript)	Testing modern web applications
Katalon Studio	Web, API & Mobile Testing	No (Basic), Optional for Advanced	Automating web application testing
Postman	API Testing	No (Basic), Yes for Advanced Scripts	Testing REST APIs

5. Real-World Automation Scenario

Scenario: Searching for a Mobile Phone on Flipkart

I would use **Selenium** to automate this process. First, Selenium will open the Flipkart website. Then it will enter the mobile phone name in the search box and click the Search button. After that, it will apply filters like price and brand, verify the search results, and check whether the correct products are displayed. This automation will save time and ensure the search functionality works correctly every time.
